

# Spartan-6 FPGA Packaging and Pinouts

## *Product Specification*

UG385 (v2.3) May 12, 2014

#### NOTICE OF DISCLAIMER

The information disclosed to you hereunder (the "Materials") is provided solely for the selection and use of Xilinx products. To the maximum extent permitted by applicable law: (1) Materials are made available "AS IS" and with all faults, Xilinx hereby DISCLAIMS ALL WARRANTIES AND CONDITIONS, EXPRESS, IMPLIED, OR STATUTORY, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, OR FITNESS FOR ANY PARTICULAR PURPOSE; and (2) Xilinx shall not be liable (whether in contract or tort, including negligence, or under any other theory of liability) for any loss or damage of any kind or nature related to, arising under, or in connection with, the Materials (including your use of the Materials), including for any direct, indirect, special, incidental, or consequential loss or damage (including loss of data, profits, goodwill, or any type of loss or damage suffered as a result of any action brought by a third party) even if such damage or loss was reasonably foreseeable or Xilinx had been advised of the possibility of the same. Xilinx assumes no obligation to correct any errors contained in the Materials or to notify you of updates to the Materials or to product specifications. You may not reproduce, modify, distribute, or publicly display the Materials without prior written consent. Certain products are subject to the terms and conditions of Xilinx's limited warranty, please refer to Xilinx's Terms of Sale which can be viewed at [www.xilinx.com/legal.htm#tos](http://www.xilinx.com/legal.htm#tos); IP cores may be subject to warranty and support terms contained in a license issued to you by Xilinx. Xilinx products are not designed or intended to be fail-safe or for use in any application requiring fail-safe performance; you assume sole risk and liability for use of Xilinx products in such critical applications, please refer to Xilinx's Terms of Sale which can be viewed at [www.xilinx.com/legal.htm#tos](http://www.xilinx.com/legal.htm#tos).

#### AUTOMOTIVE APPLICATIONS DISCLAIMER

XILINX PRODUCTS ARE NOT DESIGNED OR INTENDED TO BE FAIL-SAFE, OR FOR USE IN ANY APPLICATION REQUIRING FAIL-SAFE PERFORMANCE, SUCH AS APPLICATIONS RELATED TO: (I) THE DEPLOYMENT OF AIRBAGS, (II) CONTROL OF A VEHICLE, UNLESS THERE IS A FAIL-SAFE OR REDUNDANCY FEATURE (WHICH DOES NOT INCLUDE USE OF SOFTWARE IN THE XILINX DEVICE TO IMPLEMENT THE REDUNDANCY) AND A WARNING SIGNAL UPON FAILURE TO THE OPERATOR, OR (III) USES THAT COULD LEAD TO DEATH OR PERSONAL INJURY. CUSTOMER ASSUMES THE SOLE RISK AND LIABILITY OF ANY USE OF XILINX PRODUCTS IN SUCH APPLICATIONS.

## Revision History

The following table shows the revision history for this document.

Date	Version	Revision
06/24/2009	1.0	Initial Xilinx release.
12/08/2009	1.1	<p>Revised User I/O and Differential Pair numbers in <a href="#">Table 1-4</a>. Updated descriptions of <a href="#">SUSPEND</a>, <a href="#">CMPCS_B_2</a>, <a href="#">VFS</a>, and <a href="#">RFUSE</a>.</p> <p>Added data for the LX4 and LX75/LX75T devices and CPG196, FG(G)900, and CSG484 packages along with a complete revamping of <a href="#">Chapter 2, Pinout Tables</a> and <a href="#">Chapter 3, Pinout and I/O Bank Diagrams</a> including the LX45 in the FG(G)676 package.</p> <p>Added <a href="#">Figure 4-2</a>, the mechanical drawing for the CPG196 package. Revised <a href="#">Figure 4-1</a>, <a href="#">Figure 4-3</a>, and <a href="#">Figure 4-5</a>.</p> <p>Added values to <a href="#">Table 5-1, page 346</a>.</p>
02/22/2010	1.2	<p>Added <a href="#">Table 1-5, page 17</a>. In <a href="#">Table 1-6</a>, updated the LDC, HDC, SCPn, V<sub>BATT</sub>, VFS, and RFUSE descriptions. Added <a href="#">Spartan-6 FPGA Banks</a>, <a href="#">GTP Transceiver Locations</a>, <a href="#">Clock Inputs and BUFIN2 Clocking Regions</a>, and <a href="#">Supply Voltages for I/O and Configuration Pins</a>.</p> <p>Revised all the pinout tables in <a href="#">Chapter 2</a> to add the BUFIN2 clocking regions. Changed the <a href="#">CSG225 Package—LX4</a> discussion.</p> <p>Added a note to <a href="#">Figure 3-37</a> and updated <a href="#">Figure 3-65</a>.</p> <p>Added MDDs and PCB design reference notes to <a href="#">Chapter 4</a>.</p> <p>Added values to <a href="#">Table 5-1</a>.</p> <p>Changed the package marking in <a href="#">Figure 6-1</a>. Also updated descriptions in <a href="#">Table 6-1</a> for engineering samples and L1C.</p> <p>Added a new chapter: <a href="#">Chapter 7, Density Migration</a>.</p>

Date	Version	Revision
10/12/2010	1.3	<p>In <a href="#">Table 1-6</a>, revised description for <code>IO_LXXY_ZZZ_#</code>, <code>Dn</code>, <code>VFS</code>, <code>RFUSE</code> and added notes 1 and 2. Edited <a href="#">Clock Inputs</a> and <a href="#">BUFIO2 Clocking Regions</a>.</p> <p>In <a href="#">Table 2-3</a>, revised the BUFIO2 regions for bank 3 pins D3, D4, E1, E2, F1, F2, F3, F4, H1, and H2. In <a href="#">Table 2-5</a>, revised the BUFIO2 regions for bank 3 pins H1, K4, J3, G2, G1, K5, J4, F1, F3, J5, H4, G5, G3, H6, H5, F5, F4, E5, and E4.</p> <p>In <a href="#">Table 2-6</a>, revised the BUFIO2 regions for bank 3 pins H13, H14, J11, J12, J13, K14, J6, H5, H4, H3, L4, and L5 to add separate information for the LX25 devices.</p> <p>In <a href="#">Table 2-7</a>, revised the BUFIO2 regions for bank 1 pins C17, C18, F14, G14, D17, D18, H12, G13, E16, E18, K12, K13, F17, F18, H13, H14, H15, H16, G16, and G18, and to also add separate information for the LX25 device to bank 1 pins J13, K14, L12, L13, K15, and K16. Revised the BUFIO2 regions for bank 2 pins R15, T15, U16, V16, R13, T13, U15, V15, T14, V14, N12, P12, U13, V13, M11, N11, R11, T11, T12, V12, N10, P11, N9, U11, V11, R10, T10, U10, and V10. Revised the BUFIO2 regions for bank 3 pins N4, N3, P4, P3, L6, M5, U2, U1, T2, T1, P2, P1, N2, N1, M3, M1, L2, L1, K2, K1, L4, L3, J3, J1, H2, H1, K4, and K3, and to also add separate information for the LX25 device to bank 3 pins L5, K5, H4, H3, L7, and K6.</p> <p>In <a href="#">Table 2-8</a>, revised the BUFIO2 regions for bank 1 pins C17, C18, F14, G14, D17, D18, H12, G13, E16, E18, K12, K13, F17, F18, H13, H14, H15, H16, G16, and G18, and to also add separate information for the LX25T device to bank 1 pins J13, K14, L12, L13, K15, and K16. Revised the BUFIO2 regions for bank 2 pins R15, T15, U16, V16, R13, T13, U15, V15, T14, V14, N12, P12, U13, V13, M11, N11, R11, T11, T12, V12, N10, P11, N9, U11, V11, R10, T10, U10, and V10. Revised the BUFIO2 regions for bank 3 pins N4, N3, P4, P3, L6, M5, U2, U1, T2, T1, P2, P1, N2, N1, M3, M1, L2, L1, K2, K1, L4, L3, J3, J1, H2, H1, K4, and K3, and to also add separate information for the LX25 device to bank 3 pins L5, K5, H4, H3, L7, and K6.</p> <p>In <a href="#">Table 2-9</a>, revised the BUFIO2 regions to add separate information for the LX75 device to bank 0 pins E12, D12, F13, D13. Revised the BUFIO2 regions to add separate information for the LX25 device to bank 1 pins G20, G22, K20, K9, H21, H22. Revised the BUFIO2 regions to add separate information for the LX25 device to bank 3 pins K5, K4, K3, J4, K5, J6.</p> <p>In <a href="#">Table 2-10</a>, revised the BUFIO2 regions to add separate information for the LX25T device to bank 0 pins J20, J22, M20, M19, K21, and K22.</p> <p>In <a href="#">Table 2-13</a>, revised the BUFIO2 regions for bank 1 pins N25, N26, L19, K19, L23, L24, P20, N21, M23, N24, L17, K18, P24, P26, M19, L18, R25, R26, M18, N19, N22, N23, N17, N18, R23, R24, N20, M21, P21, and P22. Revised the BUFIO2 regions for bank 2 pins AD22, AF22, AE21, AF21, AD20, AF20, AE19, AF19, AC20, AD21, Y18, AA19, AC19, AD19, V16, W17, AD18, AF18, Y16, AA17, AA18, AB18, AE17, AF17, AD16, AF16, AE15, AF15, AB17, AC17, AC15, AD15, AC16, AD17, V15, W16, AB15, AC14, Y15, AA15, Y14, AA14, AD14, AF14, AE13, AF13. Revised the BUFIO2 regions for bank 3 pins AC7, AD7, AE3, AF2, AC4, AD4, AA7, Y6, AB7, AB6, AC5, AD5, AA5, AB5, W8, W7, AB4, AC3, AA4, AA3, W5, Y5, U8, U7, U5, V5, U4, U3, T8, T6, R5, T4, R7, R6, AB3, AB1, AD3, AD1, AC2, AC1, AE2, AE1, AA2, AA1, Y3, Y1, W2, W1, V3, V1, U2, U1, T3, T1, V4, and W3.</p> <p>In <a href="#">Table 5-1</a>, added and updated values.</p> <p>Updated <a href="#">Chapter 6</a> to add more information about the various packages offered for Spartan-6 FPGAs.</p> <p>Added <a href="#">LX25 and LX25T Migration in Chapter 7</a>.</p>
02/24/2011	2.0	<p>Revised the notation for the Ag content in <a href="#">Figure 4-4: FT(G)256 Fine-Pitch Thin BGA Package</a>.</p> <p>Updated <a href="#">LX25 and LX25T Migration in Chapter 7</a>.</p>

Date	Version	Revision
06/07/2011	2.1	Updated document descriptions in <a href="#">Additional Documentation</a> . Added reference to <i>Spartan-6 FPGA PCB Design and Pin Planning Guide</i> in <a href="#">Introduction</a> . Added reference to <i>Spartan-6 FPGA SelectIO Resources User Guide</i> to text preceding <a href="#">Table 1-4</a> . Added reference to <i>Spartan-6 FPGA SelectIO Resources User Guide</i> to <a href="#">Table 1-6</a> . Revised the tolerances for package type FG(G)676, symbol A in <a href="#">Figure 4-8</a> . Added reference to <i>Spartan-6 FPGA PCB Design and Pin Planning Guide</i> in <a href="#">Chapter 4, Summary</a> . Added reference to <i>Spartan-6 FPGA PCB Design and Pin Planning Guide</i> in <a href="#">Chapter 7, Introduction</a> .
08/24/2011	2.2	Updated the entire document to add the Defense-grade Spartan-6Q and XA Spartan-6 Automotive FPGAs. Added the CS484 package, where applicable, throughout the guide. Added <a href="#">Soldering Guidelines</a> in <a href="#">Chapter 5</a> .
05/12/2014	2.3	Updated <a href="#">Figure 4-5: FG(G)484 Fine-Pitch BGA Package - Corner Gate Mold (CGM)</a> and added <a href="#">Figure 4-6: FG(G)484 Fine-Pitch BGA Package - Pin Gate Mold (PGM)</a> . Updated <a href="#">Figure 4-8: FG(G)676 Fine-Pitch BGA Package - Corner Gate Mold (CGM)</a> and added <a href="#">Figure 4-9: FG(G)676 Fine-Pitch BGA Package - Pin Gate Mold (PGM)</a> per <a href="#">XCN12023: Pin Gate Mold Implementation For FG(G) and BG(G) Wire Bond Packages</a> . No change to form, fit, or function of the devices shipping. Added a note on <a href="#">page 346</a> above <a href="#">Table 5-1</a> and revised the $\theta_{JC}$ values for the CS(G)484 package. Updated <a href="#">NOTICE OF DISCLAIMER</a> and <a href="#">About This Guide</a> including links.

# About This Guide

---

This guide describes Spartan®-6 device pinouts and package specifications; it also includes pinout diagrams and thermal data.

## Organization of This Guide

This document is comprised of the following chapters:

- [Chapter 1, Packaging Overview](#)  
Provides an introduction to the Spartan-6 family with a summary of maximum I/Os available in each device/package combination. Also includes table of pin definitions.
- [Chapter 2, Pinout Tables](#)  
Provides pinout information for all Spartan-6 devices and packages.
- [Chapter 3, Pinout and I/O Bank Diagrams](#)  
Provides pinout diagrams for all Spartan-6 FPGA package/device combinations.
- [Chapter 4, Mechanical Drawings](#)  
Provides mechanical drawings of Spartan-6 FPGA packages.
- [Chapter 5, Thermal Specifications](#)  
Provides thermal data associated with Spartan-6 FPGA packages. Discusses Spartan-6 FPGA power management strategy and thermal management options.
- [Chapter 6, Package Marking](#)  
Provides example and description of the marking on top of the package (topmark).
- [Chapter 7, Density Migration](#)  
The guidelines in this chapter facilitate migration of designs between different Spartan-6 device/package combinations.

## Additional Documentation

A complete suite of documentation is available for the commercial (XC) Spartan-6 FPGAs at: [www.xilinx.com/support/documentation/spartan-6.htm](http://www.xilinx.com/support/documentation/spartan-6.htm).

Additional specific documentation for the Defense-grade Spartan-6Q FPGAs (XQ) is available at:

[www.xilinx.com/support/index.html/content/xilinx/en/supportNav/silicon\\_devices/fpga/spartan-6q.html](http://www.xilinx.com/support/index.html/content/xilinx/en/supportNav/silicon_devices/fpga/spartan-6q.html).

Additional specific documentation for the XA Spartan-6 Automotive FPGAs is available at: [www.xilinx.com/support/documentation/automotive\\_xa\\_devices.htm](http://www.xilinx.com/support/documentation/automotive_xa_devices.htm).

## Additional Support Resources

For support resources such as Answers, Documentation, Downloads, and Forums, see Xilinx Support: [www.xilinx.com/support](http://www.xilinx.com/support).

For a glossary of technical terms used in Xilinx documentation, see the Xilinx Glossary: [www.xilinx.com/company/terms.htm](http://www.xilinx.com/company/terms.htm).

## Solution Centers

See the Xilinx Solution Centers: [www.xilinx.com/support/solcenters.htm](http://www.xilinx.com/support/solcenters.htm) for support on devices, software tools, and intellectual property at all stages of the design cycle. Topics include design assistance, advisories, and troubleshooting tips.

# Packaging Overview

---

## Summary

This chapter covers the following topics:

- [Introduction](#)
- [Pb-free Packaging](#)
- [Device/Package Combinations and Maximum I/Os](#)
- [Pin Definitions](#)
- [Spartan-6 FPGA Banks](#)
- [Clock Inputs and BUFIN2/CLOCKOUT2 Clocking Regions](#)
- [Supply Voltages for I/O and Configuration Pins](#)

## Introduction

This section describes the pinouts for Spartan®-6 devices in various packages.

Spartan-6 devices are offered in low-cost, space-saving packages that are optimally designed for the maximum number of user I/Os. Package inductance is minimized as a result of optimal placement and even distribution as well as an increased number of Power and GND pins.

All of the Spartan-6 LX devices supported in a particular package are pinout compatible. All of the Spartan-6 LXT devices supported in a particular package are pinout compatible. The Spartan-6 LX devices are not pin compatible with the Spartan-6 LXT devices. Pins that are not available in some of the devices are listed in the “No Connects” column of each table.

Each device is split into I/O banks to allow for flexibility in the choice of I/O standards (see [UG381, Spartan-6 FPGA SelectIO Resources User Guide](#)). Global pins and power/ground pins, are listed at the end of each table. [Table 1-6](#) provides definitions for all pin types.

See [UG393, Spartan-6 FPGA PCB Design and Pin Planning Guide](#) for recommendations for board layout, PCB design rules, and pin planning.

## Pb-free Packaging

Xilinx offers lead-free devices (Pb-free) that comply with the European Union's RoHS directive (2002/95/EC). Information on the material composition of our Pb-free, RoHS compliant FPGAs is available as either material declaration data sheets or IPC 1752 forms, at <http://www.xilinx.com/support/documentation/spartan-6.htm#131532>. For more information on Pb-free packaging, see [www.xilinx.com/pbfree](http://www.xilinx.com/pbfree).

The Pb-free packages include an extra G in the package code. For example, FTG256 is the Pb-free version of the FT256 package. When referenced together, the G is incorporated as FT(G)256. The Pb and Pb-free packages are identical in pin-out, size, and thermal characteristics.

## Device/Package Combinations and Maximum I/Os

**Table 1-1** shows the package specifications and the maximum number of user I/Os possible in Spartan-6 FPGA packages. Specific information on device/package combinations by family is available at:

- [DS160: Spartan-6 Family Overview](#)
- [DS170: XA Spartan-6 Automotive Family Overview](#)
- [DS172: Defense-grade Spartan-6Q Family Overview](#)

Table 1-1: Spartan-6 FPGA Packages

	Packages								
	TQG144 <sup>(1)</sup>	CPG196	CSG225	FT(G)256 <sup>(2)</sup>	CSG324	FG(G)484 <sup>(2)</sup>	CS(G)484 <sup>(2)</sup>	FG(G)676 <sup>(2)</sup>	FG(G)900 <sup>(2)</sup>
Package Type	Quad Flat Pack	Chip Scale	Chip Scale	BGA	Chip Scale	BGA	Chip Scale	BGA	BGA
Pitch (mm)	0.5	0.5	0.8	1.00	0.8	1.00	0.8	1.00	1.00
Size (mm)	22 x 22 <sup>(1)</sup>	8 x 8	13 x 13	17 x 17	15 x 15	23 x 23	19 x 19	27 x 27	31 x 31
Maximum I/Os	102	106	160	186	232	338	338	498	576

### Notes:

1. The footprint for the TQG144 package (22 x 22 mm) is larger than the package body (20 x 20 mm).
2. These devices are available in both Pb and Pb-free (additional G) packages as standard ordering options. See the specific family overview for more information on packages offered by density.

The number of I/Os per package includes all user I/Os *except* the dedicated pins listed in [Table 1-2](#) and the GTP serial transceiver I/O channels for the devices listed in [Table 1-3](#).

**Table 1-2: Spartan-6 FPGA Dedicated Configuration Pins**

SUSPEND	PROGRAM_B_2	TDI	TMS	VFS <sup>(1)</sup>	VBATT <sup>(1)</sup>
DONE_2	CMPCS_B_2	TDO	TCK	RFUSE <sup>(1)</sup>	

**Notes:**

- Only available in LX75, LX75T, LX100, LX100T, LX150, and LX150T devices.

**Table 1-3: Number of Serial Transceivers (GTs) I/O Channels/Device**

I/O Channels	Device				
	LX25T	LX45T	LX75T <sup>(1)</sup>	LX100T <sup>(2)</sup>	LX150T <sup>(2)</sup>
MGTRXP	2	4	4 or 8	4 or 8	4 or 8
MGTRXN	2	4	4 or 8	4 or 8	4 or 8
MGTTXP	2	4	4 or 8	4 or 8	4 or 8
MGTTXN	2	4	4 or 8	4 or 8	4 or 8

**Notes:**

- The LX75T has 4 GTP I/O channels in the FG(G)484 and CS(G)484 packages and 8 GTP I/O channels in the FG(G)676 package.
- The LX100T and the LX150T have 4 GTP I/O channels in the FG(G)484 and CS(G)484 packages and 8 GTP I/O channels in the FG(G)676 and FG(G)900 packages.

**Table 1-4** shows the number of available I/Os and the number of differential pairs for each Spartan-6 FPGA device/package combination. Not all I/O standards can be used on all pins. For example, for many differential standards, the outputs are only available in banks 0 and 2. For information on banking rules, see [UG381, Spartan-6 FPGA SelectIO Resources User Guide](#).

**Table 1-4: Available I/O Pin/Device/Package Combinations**

Spartan-6 Device	User I/O Pins	Spartan-6 FPGA Package

## Pin Definitions

**Table 1-6** lists the pin definitions used in Spartan-6 FPGA packages. Further details on pin functionality is available in the device user guides:  
<http://www.xilinx.com/support/documentation/spartan-6.htm>.

**Table 1-6: Spartan-6 FPGA Pin Definitions**

Pin Name	Direction	Description
<b>User I/O Pins</b>		
IO_LXXY_#	Input/ Output	All user I/O pins are capable of differential signaling and can implement pairs <sup>(1)</sup> . Each user I/O is labeled IO_LXXY_#, where:  IO indicates a user I/O pin. LXXY indicates a differential pair, with XX a unique pair in the bank and Y = [P   N] for the positive/negative sides of the differential pair. # indicates the bank number.
<b>Multi-Function Pins</b>		
IO_LXXY_ZZZ_#		Multi-function pins are labelled IO_LXXY_ZZZ_#, where ZZZ represents one or more of the following functions in addition to being general purpose user I/O. When not used for their special function, these pins can be user I/O.
Dn	Input/ Output (during readback)	In SelectMAP/BPI modes, D0 through D15 are configuration data pins. During slave SelectMAP readback, the pins become outputs when RDWR_B = 1. These pins become user I/Os after configuration, unless the SelectMAP port is retained.
D0_DIN_MISO_MISO1	Input	In Parallel (SelectMAP and BPI) modes, D0 is the LSB of the data bus. In Bit-serial modes, DIN is the single-data input. In SPI mode, MISO is the Master Input/Slave Output. In SPI x2 or x4 modes, MISO1 is the second bit of the SPI bus.
D1_MISO2, D2_MISO3	Input	In Parallel modes, D1 and D2 are lower-order bits of the data bus. In SPI x4 mode, MISO2 and MISO3 are two MSBs of the SPI bus.
An	Output	Address A0–A25 BPI address output. These pins become user I/O after configuration.
AWAKE	Output	Status output pin for the power-saving Suspend mode. SUSPEND is a dedicated pin and AWAKE is a multi-function pin. Unless Suspend mode is enabled in the application, AWAKE is available as user I/O.
MOSI_CSI_B_MISO0	Input/ Output	In SPI modes, Master Output/Slave Input (MOSI) connects from the FPGA to the SPI flash slave data input to send read commands and starting addresses. In SelectMAP mode, CSI_B is the active-low chip-select signal. In SPI x2 or x4 modes, MISO0 is the first bit of the SPI bus.
FCS_B	Output	BPI flash chip select.
FOE_B	Output	BPI flash output enable.
FWE_B	Output	BPI flash write enable.
LDC	Output	Low during configuration in BPI mode.

Table 1-6: Spartan-6 FPGA Pin Definitions (Cont'd)

Pin Name	Direction	Description
HDC	Output	High during configuration in BPI mode.
CSO_B	Output	In Parallel modes, parallel daisy-chain chip select. In SPI mode, SPI flash chip select.
IRDY1/2, TRDY1/2	Output	Used with LogiCORE IP for PCI designs. An instantiation of the Xilinx core requires the use of either IRDY1 and TRDY1 or IRDY2 and TRDY2. See the core documentation for more details. These pins are available as user I/O when not being used for PCI designs.
DOUT_BUSY	Output	In SelectMAP mode, BUSY indicates the device status. In Bit-serial modes, DOUT gives configuration data to down-stream devices in a daisy chain.
RDWR_B_VREF	Input	In SelectMAP mode, this is the active-low write-enable signal. After configuration and if needed, RDWR_B can become a V <sub>REF</sub> in bank 2.
HSWAPEN	Input	When Low, enables I/O pullups before and during configuration.
INIT_B	Bidirectional (open-drain)	When Low, this pin indicates that the configuration memory is being cleared. When held Low, the start of configuration is delayed. During configuration, a Low on this output indicates that a configuration data error has occurred. Can be used after configuration (optional) to indicate POST_CRC status.
SCPn	Input	Suspend control pins SCP0-SCP7. Used for SUSPEND multi-pin wake-up feature.
CMPMOSI, CMPMISO, CMPLCK	N/A	Reserved for future use. Use these pins as general-purpose I/O.
M0, M1	Input	Configuration mode selection. M0 = Parallel (Low) or Serial (High). M1 = Master (Low) or Slave (High).
CCLK	Input/ Output	Configuration clock. Output in Master mode or input in Slave mode.
USERCCLK	Input	Optional user configuration clock input in Master modes.
GCLK	Input	These clock pins connect to global clock buffers. These pins become regular user I/Os when not needed for clocks.
VREF_#	N/A	These are input threshold voltage pins. They become user I/Os when an external threshold voltage is not needed (per bank). When used as a reference voltage within a bank, all V <sub>REF</sub> pins within that bank must be connected.
<b>Multi-Function Memory Controller Pins<sup>(2)</sup></b>		
M#DQn	Input/ Output	Memory controller data D[0:15] in bank #.
M#LDQS	Input/ Output	Memory controller lower data strobe in bank #.
M#LDQSN	Input/ Output	Memory controller lower data strobe N in bank #.

Table 1-6: Spartan-6 FPGA Pin Definitions (Cont'd)

Pin Name	Direction	Description
M#UDQS	Input/ Output	Memory controller upper data strobe in bank #.
M#UDQSN	Input/ Output	Memory controller upper data strobe N in bank #.
M#An	Output	Memory controller address A[0:14] in bank #.
M#BAn	Output	Memory controller bank address BA[0:2] in bank #.
M#LDM	Output	Memory controller lower data mask in bank #.
M#UDM	Output	Memory controller upper data mask in bank #.
M#CLK	Output	Memory controller clock in bank #.
M#CLKN	Output	Memory controller active-Low clock in bank #.
M#CASN	Output	Memory controller active-Low column address strobe in bank #.
M#RASN	Output	Memory controller active-Low row address strobe in bank #.
M#ODT	Output	Memory controller on-die termination control for external memory in bank #.
M#WE	Output	Memory controller write enable in bank #.
M#CKE	Output	Memory controller clock enable in bank #.
M#RESET	Output	Memory controller reset in bank #.
<b>Dedicated Pins<sup>(3)</sup></b>		
DONE_2	Input/ Output	DONE is a bidirectional signal with an optional internal pull-up resistor. As an output, this pin indicates completion of the configuration process. As an input, a Low level on DONE can be configured to delay the start-up sequence.
PROGRAM_B_2	Input	Active-Low asynchronous reset to configuration logic. This pin has a default weak pull-up resistor.
SUSPEND	Input	Active-High control input pin for the power-saving Suspend mode. SUSPEND is a dedicated pin and AWAKE is a multi-function pin. Must be enabled by configuration option. When Suspend mode is not used, connect this pin to GND.
TCK	Input	JTAG Boundary-scan clock.
TDI	Input	JTAG Boundary-scan data input.
TDO	Output	JTAG Boundary-scan data output.
TMS	Input	JTAG Boundary-scan mode select.

Table 1-6: Spartan-6 FPGA Pin Definitions (*Cont'd*)

Pin Name	Direction	Description
<b>Reserved Pins</b>		
NC	N/A	When found in a table or text file, an NC indicates that this pin is not connected in the specific device/package combination. However, in some devices in the same package, another pin name is used to describe this pin.
CMPCS_B_2	Input	Reserved. Leave unconnected or connect High (V <sub>CCO_2</sub> ).
<b>Other Pins</b>		
GND	N/A	Ground.
VBATT	N/A	Decryptor key RAM memory backup supply. Once V <sub>CCAUX</sub> is applied, V <sub>BATT</sub> can be unconnected. If key RAM is not used, connecting V <sub>BATT</sub> to V <sub>CCAUX</sub> or GND is recommended, or the pin can be left unconnected. Only available in the LX75, LX75T, LX100, LX100T, LX150, and LX150T devices.
VCCAUX	N/A	Power-supply pins for auxiliary circuits.
VCCINT	N/A	Power-supply pins for the internal core logic.
VCCO_#	N/A	Power-supply pins for the output drivers (per bank).
VFS	Input	Decryptor key EFUSE power supply pin for programming. When not programming, tie this pin to a voltage between GND and 3.45V. When not using the key EFUSE, the recommendation is to connect VFS to V <sub>CCAUX</sub> or GND, however, the pin can be left unconnected. Only available in the LX75, LX75T, LX100, LX100T, LX150, and LX150T devices.
RFUSE	Input	Decryptor key EFUSE resistor to GND for programming. When not programming or when not using the key EFUSE, connecting RFUSE to V <sub>CCAUX</sub> or GND is recommended, however, the pin can be left unconnected. Only available in the LX75, LX75T, LX100, LX100T, LX150, and LX150T devices.

Table 1-6: Spartan-6 FPGA Pin Definitions (Cont'd)

Pin Name	Direction	Description
<b>GTP Transceiver Pins (GTPA1_DUAL Primitive)<sup>(4)</sup></b>		
MGTAVCC	N/A	Power-supply pin for transceiver mixed-signal circuitry.
MGTAVTTX, MGTAVTRX	N/A	Power-supply pin for TX and RX circuitry.
MGTAVTRCAL	N/A	Power-supply pin for the resistor calibration circuit.
MGTAVCCPLL0 MGTAVCCPLL1	N/A	Power-supply pin for PLL.
MGTREFCLK0/1P	Input	Positive differential reference clock.
MGTREFCLK0/1N	Input	Negative differential reference clock.
MGTRREF	Input	Precision reference resistor pin for internal calibration termination.
MGTRXP[0:1]	Input	Positive differential receive port.
MGTRXN[0:1]	Input	Negative differential receive port.
MGTTXP[0:1]	Output	Positive differential transmit port.
MGTTXN[0:1]	Output	Negative differential transmit port.

**Notes:**

1. See banking rules in [UG381: Spartan-6 FPGA SelectIO Resources User Guide](#).
2. For further information, see [UG388: Spartan-6 FPGA Memory Controller User Guide](#).
3. Dedicated pins without a bank number (JTAG and SUSPEND) are powered by V<sub>CCAUX</sub>.
4. For further information, see [UG386: Spartan-6 FPGA GTP Transceivers User Guide](#).

## Spartan-6 FPGA Banks

Bank designations at the end of each pin name indicate the bank number for that pin. There are both I/O banks and GTP transceiver banks in the Spartan-6 family.

### Spartan-6 FPGA I/O Banks

Each Spartan-6 device contains either four or six I/O banks depending on device size and package. Each bank varies in the number of available and bonded I/O, with as few as 18 and as many as 114 I/O available in one bank.

- LX45/LX45T and smaller and all devices in the CS(G)484 and FG(G)484 packages have four I/O banks, one on each side of the device.
- LX75/LX75T and larger in the FG(G)676 and FG(G)900 packages have two I/O banks on the left and right sides for a total of six I/O banks.

### Spartan-6 LXT FPGA GTP Transceiver Banks

There are from one to four GTPA1\_DUAL tiles in each Spartan-6 LXT device. Each GTPA1\_DUAL tile has its own power supplies and bank designation. GTP transceiver banks 101 and 123 are embedded in I/O bank 0, and GTP transceiver banks 245 and 267 are embedded in I/O bank 2.

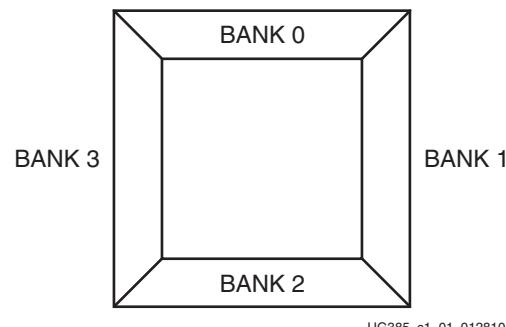

## Spartan-6 FPGA Bank Information

**Table 1-7** shows the bank names and locations. Not all banks are available in every device/package combination.

**Table 1-7: Spartan-6 FPGA Bank Numbering**

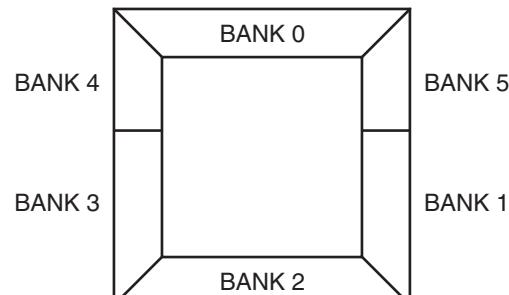

Bank	Locations	Description
0	Top	All devices
1	Right	All devices
2	Bottom	All devices; contains most configuration pins
3	Left	All devices
4	Left, Top	Extra bank in LX75/LX75T, LX100/LX100T, LX150/LX150T in FG(G)676 and FG(G)900 packages
5	Right, Top	Extra bank in LX75/LX75T, LX100/LX100T, LX150/LX150T in FG(G)676 and FG(G)900 packages
101	Top, Left	GTP transceiver bank in all LXT devices
123	Top, Right	GTP transceiver bank in LX45T, LX75T, LX100T, LX150T
245	Bottom, Left	GTP transceiver bank in LX75T, LX100T, LX150T in FG(G)676 and FG(G)900 packages
267	Bottom, Right	GTP transceiver bank in LX75T, LX100T, LX150T in FG(G)676 and FG(G)900 packages

[Figure 1-1](#) through [Figure 1-5](#) visually describe a device view of the FPGA bank numbering.

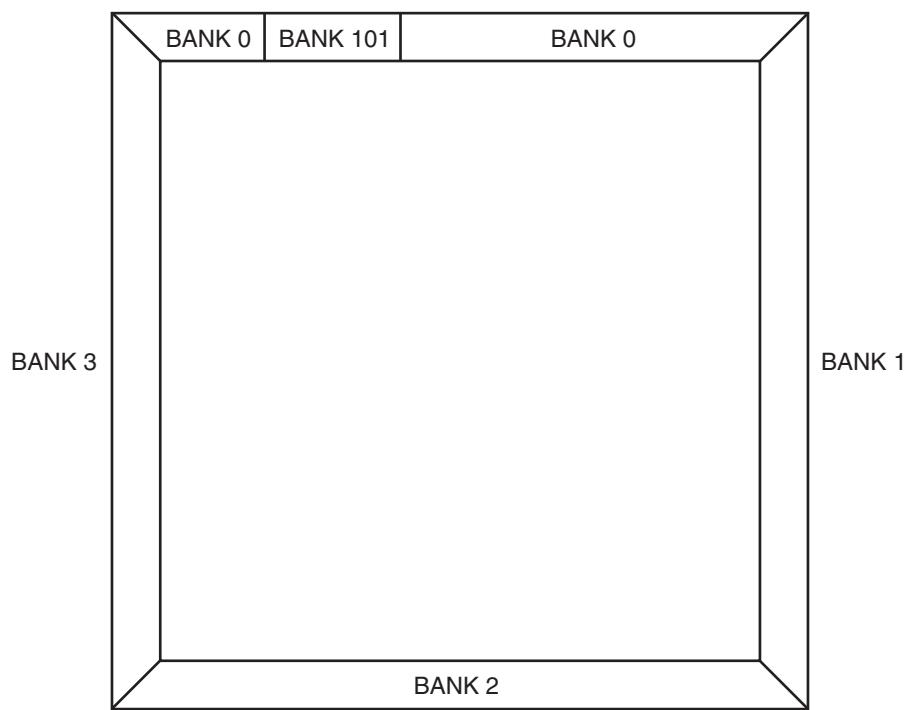

UG385\_c1\_01\_012810

*Figure 1-4: I/O and GTP Banks for LX45T, LX75T, LX100T, and LX150T Devices in the CSG324, FG(G)484, and CS(G)484 Packages*

*Figure 1-5: I/O and GTP Banks for LX75T, LX100T, and LX150T Devices in the FG(G)676 and FG(G)900 Packages*

## GTP Transceiver Locations

The position of GTPA1\_DUAL tiles is specified by an XY coordinate system (where X = column, Y = row) for location constraints. The Spartan-6 LX25T and LX45T devices have all the GTP transceivers located in a row along the top of the device. For these devices with only a top row, the value of the Y coordinate is always 0. The LX75T, LX100T, and LX150T devices have one GTP transceiver row at the top and one GTP transceiver row at the bottom of the device. For these devices, the value of the Y coordinate of the bottom row is 0, and for the top row is 1. [Table 1-8](#) shows the association between GTP transceiver locations and GTP transceiver I/O banks. See [UG386, Spartan-6 FPGA GTP Transceivers User Guide](#) for more information.

**Table 1-8: GTP Transceiver Bank to GTP Transceiver Location**

Devices	GTP Transceiver Bank Number	GTP Transceiver Location
LX25T, LX45T	101	X0Y0
LX75T, LX100T, LX150T		X0Y1
LX45T	123	X1Y0
LX75T, LX100T, LX150T		X1Y1
LX75T, LX100T, LX150T	245	X0Y0
LX75T, LX100T, LX150T	267	X1Y0

## Clock Inputs and BUFI02 Clocking Regions

Banks 0, 1, 2, and 3 each contain eight GCLK input pins, providing a total of 32 dual-purpose pins for use as clock inputs. The CPG196 package connects only four of the eight clock inputs in bank 2.

Global clock (GCLK) input pins can connect directly to the global clock buffers (BUFGs), to the BUFI02 and then to local I/O clocking, or to the BUFI02 and then to DCMs and PLLs. Each Spartan-6 device has 16 BUFGs. Each BUFG can be driven by one of two GCLK pins. When driving a global clock buffer directly with a global clock input, the global clock inputs from banks 0 and 1 share the same eight BUFGs. Similarly, banks 2 and 3 share eight BUFGs.

There are four high-speed I/O clocks in every half-edge of the device, driven by four dedicated BUFI02 buffers. Each side of the device has two separated I/O clock regions. These BUFI02 clocking regions are noted in the pinout tables in [Chapter 2](#). For example, TL indicates that the I/O is driven by the BUFI02 clocking region in the left half of the top edge (bank 0) of the device. It is possible to span an entire bank with a single I/O clock input that is connected to the BUFI02 buffers on both sides.

For further details on global and I/O clocks, see [UG382, Spartan-6 FPGA Clocking Resources User Guide](#).

## Supply Voltages for I/O and Configuration Pins

Output buffers within a given I/O bank (banks 0 through 5) must share the same output drive source voltage,  $V_{CCO}$ .

The dedicated DONE and PROGRAM\_B configuration pins are in bank 2. The other dedicated configuration pins are powered by  $V_{CCAUX}$ . Dual-purpose configuration pins are powered by the  $V_{CCO}$  of the bank in which they are located. For more details on configuration pins, see [UG380, Spartan-6 FPGA Configuration User Guide](#).

# *Pinout Tables*

---

## Summary

This chapter includes the pinout information tables for the packages cross-referenced by device in [Table 2-1](#). The ASCII text files of each device/package combination are available at <http://www.xilinx.com/support/packagefiles/spartan-6-pkgs.htm>.

## TQG144 Package—LX4 and LX9

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## CPG196 Package—LX4, LX9, and LX16

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## CSG225 Package—LX4

Although the LX4 devices are pin compatible with the LX9 and LX16 devices in the CSG225 package (see [Table 2-5, CSG225 Package—LX9 and LX16, on page 50](#)), the LX4 does not contain the Memory Controller block or support for BPI/Master Parallel mode. The dual-purpose pin names for these features are not the same as the LX4 pin names. For convenience, the No Connect column in [Table 2-5](#) lists the LX4 pins that are not connected.

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## CSG225 Package—LX9 and LX16

See [Table 2-4, CSG225 Package—LX4, on page 42](#) for LX4 pinouts.

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## FT(G)256 Package—LX9, LX16, and LX25

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## CSG324 Package—LX9, LX16, LX25, and LX45

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## CSG324 Package—LX25T and LX45T

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## FG(G)484 Package—LX25, LX45, LX75, LX100, and LX150

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## FG(G)484 Package—LX25T, LX45T, LX75T, LX100T, and LX150T

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## CS(G)484 Package—LX45, LX75, LX100, and LX150

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## CS(G)484 Package—LX45T, LX75T, LX100T, and LX150T

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## FG(G)676 Package—LX45

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## FG(G)676 Package—LX75, LX100, and LX150

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 and bank 5 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 and bank 4 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## FG(G)676 Package—LX75T, LX100T, and LX150T

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 and bank 5 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 and bank 4 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## FG(G)900 Package—LX150

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 and bank 5 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 and bank 4 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

## FG(G)900 Package—LX100T and LX150T

The BUFIO2 clocking region column lists the BUFIO2 clock sources that connect to the I/O clock input for the associated pin. For more information see [Clock Inputs and BUFIO2 Clocking Regions in Chapter 1](#).

BUFIO2 Region	Description
TL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 0 (top).
TR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 0 (top).
RT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 1 and bank 5 (right).
RB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 1 (right).
BL	I/O clock is driven by any one of the four BUFIO2s located in the left side of bank 2 (bottom).
BR	I/O clock is driven by any one of the four BUFIO2s located in the right side of bank 2 (bottom).
LT	I/O clock is driven by any one of the four BUFIO2s located in the top side of bank 3 and bank 4 (left).
LB	I/O clock is driven by any one of the four BUFIO2s located in the bottom side of bank 3 (left).

# *Pinout and I/O Bank Diagrams*

---

## Summary

This chapter provides pinout diagrams for each Spartan-6 FPGA package/device combination.

The multi-function I/O pins in these diagrams are represented by symbols based on functionality, using the following precedence:

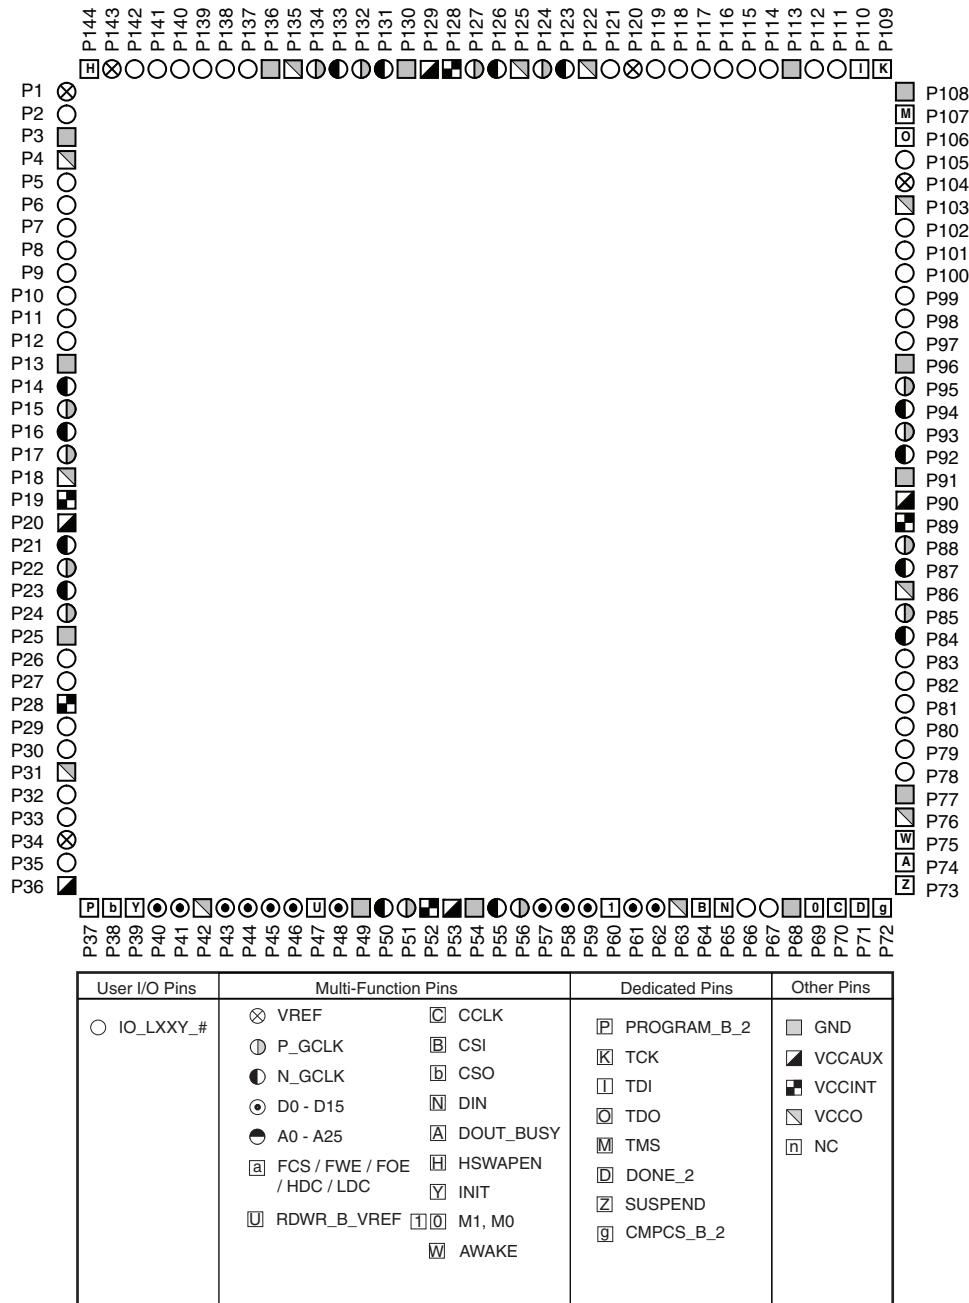

- VREF
- GCLK
- D0–D15
- A0–A25

For example, a pin description such as IO\_L37N\_GCLK12\_0 is represented with an N\_GCLK symbol, a pin description such as IO\_L1N\_VREF\_0 is represented with a VREF symbol, and a pin description such as IO\_L13N\_D10\_2 is represented with a D0–D15 symbol.

*Table 3-1: Cross-Reference for Pinout and I/O Bank Diagrams*

# *Thermal Specifications*

---

## Summary

This chapter provides thermal data associated with Spartan-6 FPGA packages. The following topics are discussed:

- [Introduction](#)
- [Cavity-Up Plastic BGA Packages](#)
- [Support for Compact Thermal Models \(CTM\)](#)
- [Soldering Guidelines](#)
- [References](#)

## Introduction

Spartan-6 devices are offered in a wide variety of packages. The suite of packages is used to address the various power requirements of the Spartan-6 devices. All Spartan-6 devices are implemented in the 45 nm process technology.

All Spartan-6 devices feature versatile SelectIO™ resources that support a variety of I/O standards. They also include DSPs and other traditional features and blocks (such as block RAM) contained in earlier Spartan and Virtex® products.

In line with Moore's law, the transistor count in this family of devices has been increased substantially. Though several innovative features at the silicon level have been deployed to minimize power dissipation, including leakage at the 45 nm node, these products have more densely packed transistors and embedded blocks with the capability to run faster than before. Thus, a fully configured Spartan-6 FPGA design that exploits the internal logic speed and incorporates several embedded circuits and systems can present power consumption challenges that must be managed.

Unlike features in an ASIC or a microprocessor, the combination of FPGA features used in a user application are not known to the component supplier. Therefore, it remains a challenge for Xilinx to predict the power requirements of a given FPGA when it leaves the factory. Accurate estimates are obtained when the board design takes shape. For this purpose, Xilinx offers and supports a suite of integrated device power analysis tools to help users quickly and accurately estimate their design power requirements. Spartan-6 devices are supported similarly to previous FPGA products. The uncertainty of design power requirements makes it difficult to apply canned thermal solutions to fit all users. Therefore, Xilinx devices do not come with preset thermal solutions. The user's operating conditions dictate the appropriate solution.

**Table 5-1** shows the thermal resistance data for Spartan-6 devices (grouped in the packages offered). The data includes junction-to-ambient in still air, junction-to-case, and junction-to-board data based on standard JEDEC four-layer measurements.

Note: The data in Table 5-1 is for device/package comparison purposes only. Do not apply directly to your system design. Attempts to recreate this data are only valid using the steady-state measurement technique outlined in JESD51-2a, JESD51-6, and JESD51-8.

- Thermal data is available on the Xilinx website at:  
<http://www.xilinx.com/cgi-bin/thermal/thermal.pl>
- Compact package thermal models for these products are available on the Xilinx support download center (under the Device Model tab) at:  
<http://www.xilinx.com/support/download/index.htm>

## Package Strategy

### Cavity-Up Plastic BGA Packages

BGA is a plastic package technology that utilizes area array solder balls at the bottom of the package to make electrical contact with the system circuit board. The area array format of solder balls reduces package size considerably when compared to leaded products. It also results in improved electrical performance as well as having higher manufacturing yields.

The substrate is made of a multilayer BT (bismaleimide triazine) epoxy-based material. Power and ground pins are grouped together and the signal pins are assigned in the perimeter format for ease of routing on to the board. The package is offered in a die up format and contains a wirebonded device that is covered with a mold compound.

### Package Construction

**Figure 5-1: Cavity-Up Ball Grid Array Package**

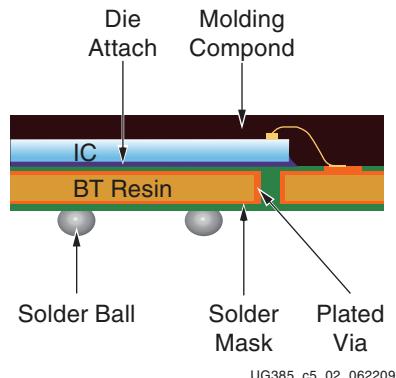

As shown in the cross section of [Figure 5-1](#), the BGA package contains a wire bonded die on a single-core printed circuit board with an overmold. Beneath the die are the thermal vias which can dissipate the heat through a portion of the solder ball array and ultimately into the power and ground planes of the system circuit board. This thermal management technique provides better thermal dissipation than a standard PQFP package. Metal planes also distribute the heat across the entire package, enabling a 15–20% decrease in thermal resistance to the case.

### Key Features/Advantages of Cavity-Up BGA Packages

- Low profile and small footprint
- Enhanced thermal performance
- Excellent board-level reliability

### Chip Scale Packages

Chip Scale (CSP) packages meet the demands of miniaturization while offering improved performance. Applications for CSP packages are targeted to portable and consumer products where real estate is of utmost importance, miniaturization is key, and power consumption/dissipation must be low. By employing Spartan-6 FPGA CSP packages, system designers can dramatically reduce board real estate. Xilinx CSP packages are rigid BT-based substrates (see [Figure 5-2](#)).

UG385\_c5\_02\_062209

Figure 5-2: Rigid BT-Based Substrate CSP Packages

### Key Features/Advantages of CSP Packages

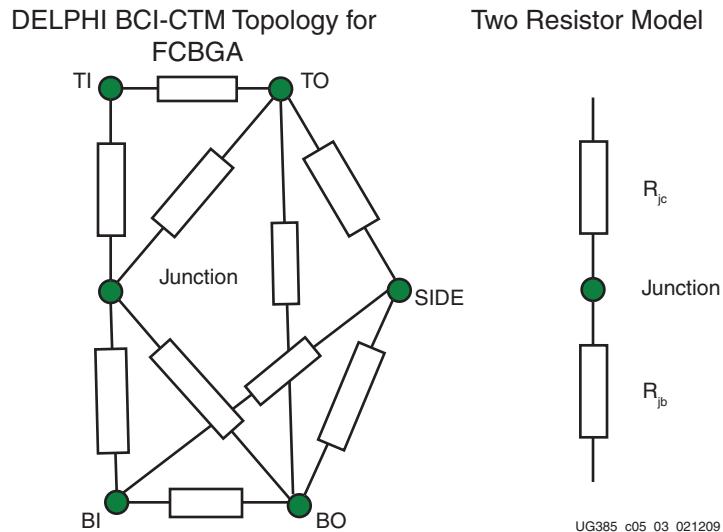

- An extremely small form factor which significantly reduces board real estate for such applications as portable and wireless designs and PC add-in cards
- Lower inductance and lower capacitance
- The absence of thin, fragile leads found on other packages
- A very thin, light-weight package

## Support for Compact Thermal Models (CTM)

Table 5-1 provides the traditional thermal resistance data for Spartan-6 devices. These resistances are measured using a prescribed JEDEC standard that might not necessarily reflect the user's actual board conditions and environment. The quoted  $\theta_{JA}$  and  $\theta_{JC}$  numbers are environmentally dependent, and JEDEC has traditionally recommended that these be used with that awareness. For more accurate junction temperature prediction, these might not be enough, and a system-level thermal simulation might be required. Though Xilinx continues to support these figure of merit data, for Spartan-6 FPGAs, boundary conditions independent compact thermal models (BCI-CTM) are also available to assist users in their thermal simulations.

Two-resistor as well as eight to ten-resistor network models are offered for all Spartan-6 devices. These compact models seek to capture the thermal behavior of the packages more accurately at predetermined critical points (junction, case, top, leads, and so on) with the reduced set of nodes as illustrated in Figure 5-3.

Unlike a full 3D model, these are computationally efficient and work well in an integrated system simulation environment. Delphi CTM models are available on the Xilinx support download center at: <http://www.xilinx.com/support/download/index.htm>.

**Figure 5-3: Thermal Model Topologies**

The CTM models are based on the DELPHI approach that JEDEC has proposed. Since the JEDEC neutral (XML) format proposal has not been adopted yet, the DELPHI approach is used to generate these files and the data saved in the NATIVE and proprietary file formats of the targeted CFD tools - rather than follow a neutral file format. The CTM libraries are available in Flotherm (PDML) format – good for V5.1 and above and Icepak (version 4.2 and above) format.

## Soldering Guidelines

To implement and control the production of surface-mount assemblies, the dynamics of the solder reflow process and how each element of the process is related to the end result must be thoroughly understood.

Note: Xilinx recommends that customers qualify their custom PCB assembly processes using package samples. [UG112: Device Package User Guide](#) contains further details on recommended assembly procedures.

The primary phases of the reflow process are:

1. Melting the particles in the solder paste
2. Wetting the surfaces to be joined
3. Solidifying the solder into a strong metallurgical bond

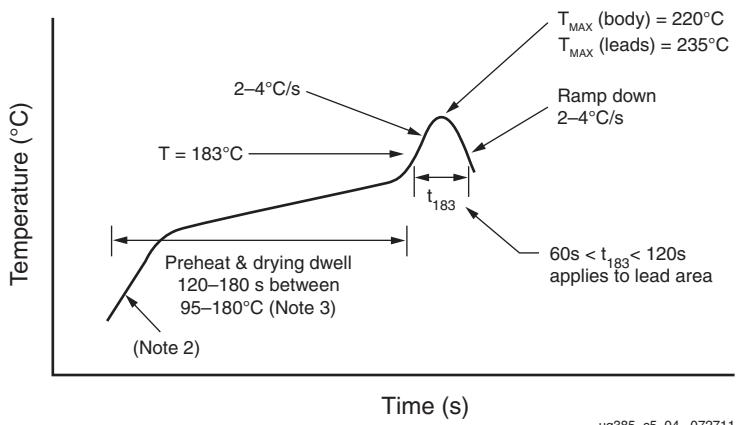

In a Pb-free soldering system, the sequences are the same. However, for the Pb-free soldering system, higher reflow temperature is applied. The peak reflow temperature of a plastic surface-mount component (PSMC) body should not be more than 220°C for standard packages and 245–260°C for Pb-free packages (package size dependent). For multiple BGAs in a single board and because of surrounding component differences, Xilinx recommends checking all BGA sites for varying temperatures.

The infrared reflow (IR) process is strongly dependent on equipment and loading. Components might overheat due to lack of thermal constraints. Unbalanced loading can lead to significant temperature variation on the board. These guidelines are intended to assist users in avoiding damage to the components; the actual profile should be determined by those using these guidelines. For complete information on package

moisture / reflow classification and package reflow conditions, refer to the Joint IPC/JEDEC Standard J-STD-020C.

## Sn/Pb Reflow Soldering

**Figure 5-4** shows typical conditions for solder reflow processing of Sn/Pb soldering using IR/convection. Both IR and convection furnaces are used for BGA assembly. The moisture sensitivity of PSMCs must be verified prior to surface-mount flow.

ug385\_c5\_04\_072711

**Figure 5-4: Typical Conditions for IR Reflow Soldering of Sn/Pb Solder**

### Notes for Figure 5-4:

1. Maximum temperature range = 220°C (body). Minimum temperature range before 205°C (leads/balls).
2. Preheat drying transition rate 2–4°C/s
3. Preheat dwell 95–180°C for 120–180 seconds
4. IR reflow must be performed on dry packages

## Pb-Free Reflow Soldering

Xilinx uses a matte Sn lead finish for lead-frame packages and SnAgCu solder balls for BGA packages. In addition, suitable material are qualified for the higher reflow temperatures (245°C–260°C) required by Pb-free soldering processes.

Lead frame packages (TQG) from Xilinx are backwards compatible, that is the component can be soldered with Sn/Pb solder using a Sn/Pb soldering process. Lead-frame packages from Xilinx use a matte Sn plating on the leads which is compatible with Pb-free and Sn/Pb soldering alloys.

Xilinx does not recommend soldering BGA packages (CPG, CSG, FTG, FGG) with SnPb solder using a Sn/Pb soldering process. Traditional Sn/Pb soldering processes have a peak reflow temperature of 220°C. At this temperature range, the SnAgCu BGA solder balls do not properly melt and wet to the soldering surfaces. As a result, reliability and assembly yields can be compromised.

The optimal profile must take into account the solder paste/flux used, the size of the board, the density of the components on the board, and the mix between large components and smaller, lighter components. Profiles should be established for all new board designs

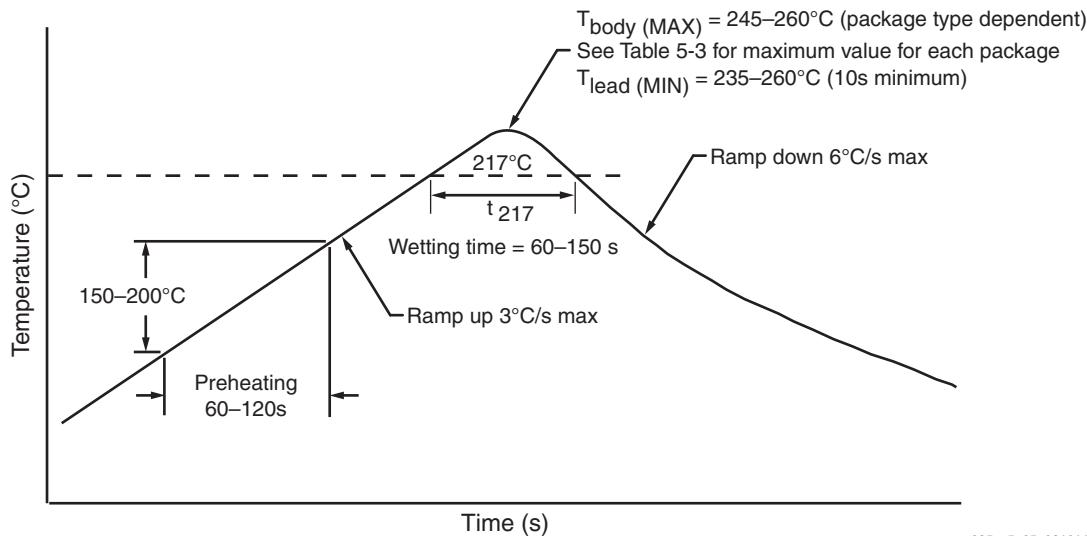

using thermocouples at multiple locations on the component. In addition, if there is a mixture of devices on the board, then the profile should be checked at various locations on the board. Ensure that the minimum reflow temperature is reached to reflow the larger components and at the same time, the temperature does not exceed the threshold temperature that might damage the smaller, heat sensitive components.

**Table 5-2** and **Figure 5-5** provide guidelines for profiling Pb-free solder reflow.

In general, a gradual, linear ramp into a spike has been shown by various sources to be the optimal reflow profile for Pb-free solders (**Figure 5-5**). This profile has been shown to yield better wetting and less thermal shock than conventional ramp-soak-spike profile for the Sn/Pb system. SnAgCu alloy reaches full liquidus temperature at 235°C. When profiling, identify the possible locations of the coldest solder joints and ensure that those solder joints reach a minimum peak temperature of 235°C for at least 10 seconds. It might not be necessary to ramp to peak temperatures of 260°C and above. Reflowing at high peak temperatures of 260°C and above can damage the heat sensitive components and cause the board to warp. Users should reference the latest IPC/JEDEC J-STD-020 standard for the allowable peak temperature on the component body. The allowable peak temperature on the component body is dependent on the size of the component. Refer to **Table 5-2** for peak package reflow body temperature information. In any case, use a reflow profile with the lowest peak temperature possible.

**Table 5-2: Pb-Free Reflow Soldering Guidelines**

Profile Feature	Convection, IR/Convection
Ramp-up rate	3°C/s maximum
Preheat Temperature 150°–200°C	60–120 seconds
Temperature maintained above 217°C	60–150 seconds (60–90 seconds typical)
Time within 5°C of actual peak temperature	30 seconds maximum
Peak Temperature (lead/ball)	235°C minimum, 245°C typical (depends on solder paste, board size, components mixture)
Peak Temperature (body)	245°C–260°C, package body size dependent (reference <b>Table 5-3</b> )
Ramp-down Rate	6°C/s maximum
Time 25°C to Peak Temperature	3.5 minutes minimum, 5.0 minutes typical, 8 minutes maximum

ug385\_c5\_05\_081611

**Figure 5-5: Typical Conditions for Pb-Free Reflow Soldering****Table 5-3: Peak Package Reflow Body Temperature for Xilinx Pb-Free Packages (Based on J-STD-020 Standard)**

Package	Peak Package Reflow Body Temperature		JEDEC Moisture Sensitivity Level (MSL)
<b>Lead Frame</b>			
TQFP	TQG144	260°C	3
<b>BGA</b>			
BGA	FTG256	260°C	3
	FGG484	250°C	3
	FGG676		
Chip Scale	FGG900		
	CPG196		
	CSG225		
	CSG324		
Chip Scale	CSG484	260°C	3

For sophisticated boards with a substantial mix of large and small components, it is critical to minimize the  $\Delta T$  across the board ( $<10^\circ\text{C}$ ) to minimize board warpage and thus, attain higher assembly yields. Minimizing the  $\Delta T$  is accomplished by using a slower rate in the warm-up and preheating stages. Xilinx recommends a heating rate of less than  $1^\circ\text{C}/\text{s}$  during the preheating and soaking stages, in combination with a heating rate of not more than  $3^\circ\text{C}/\text{s}$  throughout the rest of the profile.

It is also important to minimize the temperature gradient on the component, between top surface and bottom side, especially during the cooling down phase. The key is to optimize cooling while maintaining a minimal temperature differential between the top surface of the package and the solder joint area. The temperature differential between the top surface of the component and the solder balls should be maintained at less than  $7^\circ\text{C}$  during the critical region of the cooling phase of the reflow process. This critical region is in the part of the cooling phase where the balls are not completely solidified to the board yet, usually

between the 200°C–217°C range. To efficiently cool the parts, divide the cooling section into multiple zones, with each zone operating at different temperatures.

# Package Marking

---

The Spartan-6 devices in the TQ, CS, and FG packages have package top-markings similar to the example shown in [Figure 6-1](#) and explained in [Table 6-1](#). In BGA packages, the ball A1 indicator is in the top-left corner. In the TQG144 packages, the pin P1 indicator is in the bottom left of the mark.

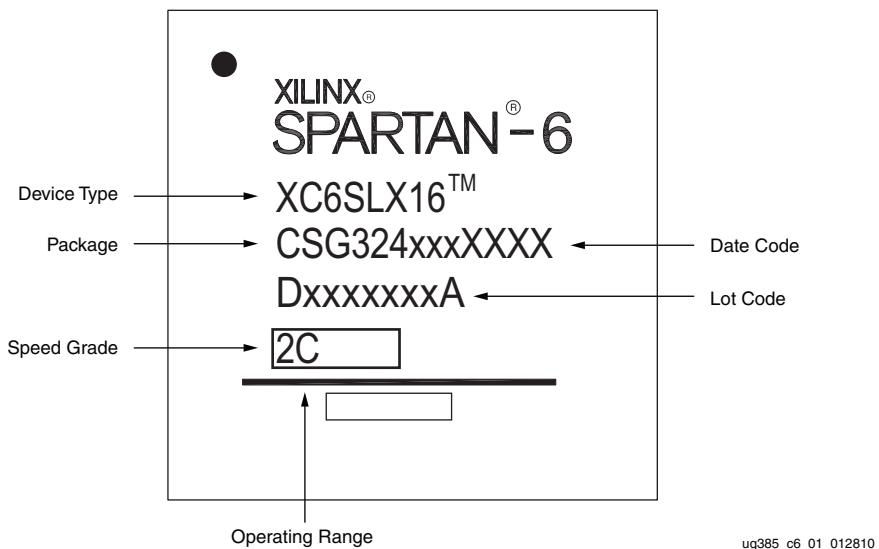

Figure 6-1: Spartan-6 Device Package Marking

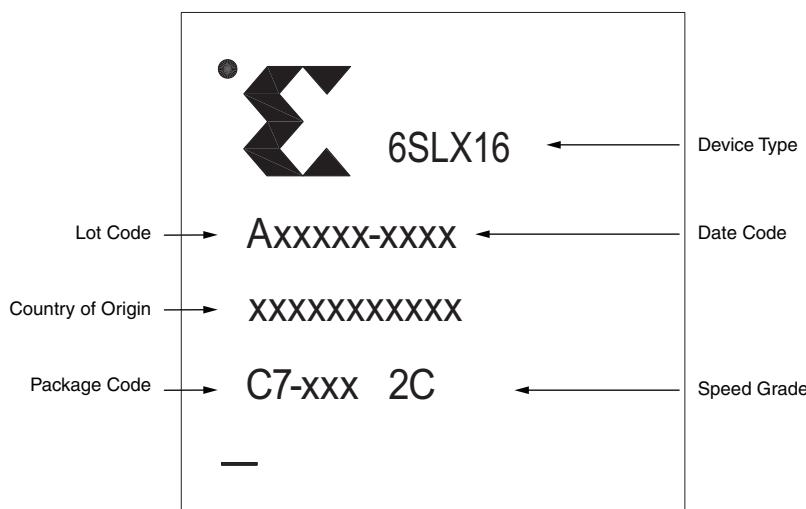

Table 6-1: Xilinx Device Marking Definition—Example

Item	Definition
Xilinx Logo	Xilinx logo, Xilinx name with trademark, and trademark-registered status.
Family Brand Logo	Spartan-6 family name with trademark and trademark-registered status. This line is optional and could appear blank.
1st Line	Device type.
2nd Line	Package code, circuit design revision, the location code for the wafer fab, the geometry code, and date code. A G in the third letter of a package code indicates a Pb-free RoHS compliant package. For more details on Xilinx Pb-Free and RoHS Compliant Products, see: <a href="http://www.xilinx.com/pbfree">http://www.xilinx.com/pbfree</a> .
3rd Line	Ten alphanumeric characters for Assembly and Lot information. The last digit is usually an A or an M.

Table 6-1: Xilinx Device Marking Definition—Example (Cont'd)

Item	Definition	
4th Line	Device speed grade and temperature range. If a grade is not marked on the package, the product is considered commercial grade. Other variations for the 4th line:	
	L1C	The L1C indicates a lower-power (1.0V core voltage) device with a -1L speed grade.
	2C-xxxx	The xxxx indicates the SCD for the device. An SCD is a special ordering code that is not always marked in the device top mark.
	2C-ES	An ES, when present, indicates an Engineering Sample.

The Spartan-6 devices in the CPG196 package have package top-markings similar to the example shown in [Figure 6-2](#) and explained in [Table 6-2](#). The package markings are abbreviated.

ug385\_c6\_02\_100510

Figure 6-2: Spartan-6 Device CPG196 Package Marking

Table 6-2: Xilinx CPG196 Device Marking Definition—Example

Item	Definition	
1st Line	Xilinx Logo, Device type. Abbreviated without the leading XC.	
2nd Line	Lot code and date code (abbreviated).	
3rd Line	Country of Origin	
4th Line	Package code (C7 = CPG196), circuit design revision, the location code for the wafer fab, the geometry code, and the device speed grade and temperature (in this example: 2C). Other variations for the 4th line:	
	L1C	An L1C indicates a lower-power (1.0V core voltage) device with a -1L speed grade.
	2C ES	An ES, when present, indicates an Engineering Sample.

# Density Migration

---

## Introduction

Spartan-6 FPGA pinouts are 100% compatible across density in the same package and within the same set of LX or LXT devices. Designs implemented in a given device/package combination can be migrated up or down in density without changing a board layout. The guidelines in this chapter facilitate migration between Spartan-6 devices. For general information on pin planning, see the I/O Pin and Clock Planning chapter in [UG393, Spartan-6 FPGA PCB Design and Pin Planning Guide](#).

## Compatibility

A common layout for multiple devices using the same package is the goal of pinout compatibility. Generally, the only difference between densities is the number or placement of No Connects (NCs) within the package. In Spartan-6 FPGAs, all pins maintain their same names from one density to the next. However, there are some unique situations where pin names change because of differences in functionality from one density to the next, as explained in the [Special Cases](#) section.

All Spartan-6 LX devices are pinout compatible in the same package, and all Spartan-6 LXT devices are pinout compatible in the same package. The Spartan-6 LX and Spartan-6 LXT devices are not pinout compatible in the same package due to the additional GTP transceiver pins in the LXT family. Although many of the other pins are in the same location, there can be significant differences between LX and LXT devices, and migration between devices requires a different board layout.

Package compatibility refers only to changing densities within a common package. No compatibility between packages, even between packages with the same amount of pins, such as the FG(G)484 and the CS(G)484, is implied. However, a design using one package can be implemented in another package with a similar quality of results, since the pin locations are similar. The Spartan-6 LX devices and LXT devices use the same package designators for common packages, such as FG(G)484, even though the pinouts are different. There is no difference in pinout between the Pb-free packages and the leaded equivalent, such as the FGG484 and the FG484.

The Spartan-6 FPGA pinouts are optimized for the unique Spartan-6 FPGA architecture. No compatibility is implied between the Spartan-6 FPGA pinouts and any other FPGA family.

The Spartan-6 FPGA pinout compatibility is summarized in [Table 7-1](#).

**Table 7-1: Pinout Compatibility Summary**

Device	Device	Compatible?
Any LX device, any package	Any LX device, any package	Yes
Any LXT device, any package	Any LXT device, any package	Yes
LX device	LXT device	No
Any device and package, Pb-free	Same device and package, Pb-equivalent	Yes
Any package	Different package	No
Spartan-6 FPGA	Other FPGAs	No

## No Connects

The primary difference between densities in the same package is the number or location of the No Connects (NCs). To make a board layout compatible, refer to [Chapter 2, Pinout Tables](#) and prohibit the use of any pin where a potential target density is shown in the NC column.

Typically, the largest device in a package has zero No Connects and smaller devices add NCs as the size limits the amount of I/O available. In the Spartan-6 family, there are instances where a larger density has fewer I/O than the smaller device in the same package. Referring to [Table 1-4, page 16](#) for example, the I/O available is less than for a smaller device for the LX25 and LX45 in the CSG324, the LX75 in the FG(G)484, and the LX75T in the CS(G)484 and FG(G)484. In these instances, the available I/O count in banks 0 and 2 (top and bottom) is reduced in the larger device. The I/O count per bank is shown in [Table 1-5, page 17](#).

No Connects can be in different locations in one density versus another. To create a compatible pinout across densities, all the potential NCs should be prohibited, which can result in fewer usable I/O than the number available in the device with the fewest I/O. For example, in the CS(G)484 package, out of the 338 I/O in the two largest devices (LX100 and LX150), the LX75 has 10 NCs (328 I/O) and the LX45 has 18 NCs (320 I/O). Since the NCs are on different pins, all 28 NCs are used to create a 310 I/O pinout that can be migrated between the LX45 and LX75.

No Connects are almost always on single-purpose pins. Dual-purpose pins, including memory controller pins and configuration pins, are used consistently across all densities in a package. The only exception is the CSG225 package, because the LX4 does not include the memory controllers and does not support parallel configuration.

**Table 7-2** and **Table 7-3** show the number of I/Os to produce compatibility across various density ranges in a package. For all the ranges not noted, the pinout of the lowest I/O count device is compatible with the rest of the range. A design can simply be implemented in the device with the lowest I/O count and restricted to the same pinout if migrated to a device with more I/O.

**Table 7-2: I/O Count for Compatibility Across Density Ranges in LX Family**

Package	I/O Count	LX4	LX9	LX16	LX25	LX45	LX75	LX100	LX150
TQG144	Total I/O	102	102						
	Compatible I/O		102						
CPG196	Total I/O	106	106	106					
	Compatible I/O			106					
CSG225	Total I/O	132	160	160					
				132					
	Compatible I/O			160					
FT(G)256	Total I/O		186	186	186				
	Compatible I/O			186					
CSG324	Total I/O		200	232	226	218			
					200				
	Compatible I/O				226				
					218				
CS(G)484	Total I/O					320	328	338	338
							310 <sup>(1)</sup>		
	Compatible I/O							328	
									338
FG(G)484	Total I/O				266	316	280	326	338
					254 <sup>(1)</sup>				
	Compatible I/O						226 <sup>(1)</sup>		
							270 <sup>(1)</sup>		
								280	
									326
FG(G)676	Total I/O					358	408	480	498
							324 <sup>(1)</sup>		
	Compatible I/O							408	
									480
FG(G)900	Total I/O								576

**Notes:**

1. The compatible number of I/O is less than the number of I/O in the device with the lowest I/O count because NCs do not completely align with each other.

Table 7-3: I/O Count for Compatibility Across Density Ranges in the LXT Family

Package	I/O Count	LX25T <sup>(1)</sup>	LX45T	LX75T	LX100T	LX150T
CSG324	Total I/O	190	190			
	Compatible I/O	190				
CS(G)484	Total I/O		296	292	296	296
	Compatible I/O		292			
				296		
FG(G)484	Total I/O	250	296	268	296	296
	Compatible I/O	250		226 <sup>(2)</sup>		
		268		296		
FG(G)676	Total I/O			348	376	396
	Compatible I/O			348		
					376	
FG(G)900	Total I/O				498	540
	Compatible I/O				498	

**Notes:**

1. The LX25T devices have NCs in place of one GTPA1\_DUAL available in the larger devices.
2. The compatible number of I/O is less than the number of I/O in the device with the lowest I/O count because the NCs do not completely align with each other.

## Special Cases

### MCBs and Parallel Configuration in the LX4

The LX4 device does not support Memory Controller Blocks (MCBs) or parallel configuration modes. The same is true of all devices in the TQG144 and CPG196 packages, but in the CSG225 package the larger devices support these functions. Therefore, the names of several I/O on the LX4 are different than the LX9 and LX16 in the CSG225 because the dual function name is not included in the pin name. For example, pin B14 is IO\_L1P\_A25\_1 in the LX9 and LX16 but IO\_L1P\_1 in the LX4. This name change does not affect its compatibility as an I/O pin.

### GTP Transceiver Connections in the LX25T

The LX25T device, available in the CSG324 and FG(G)484 packages, has two GTP transceiver ports. The other LXT devices in these packages have four GTP transceiver ports. The two additional ports are left as No Connects in the LX25T in the CSG324 and FG(G)484 packages. Therefore, the LX25T has more NCs than is implied by the I/O count. For example, although the LX25T and LX45T have the same I/O count in the CSG324 package, the LX25T has 17 NCs while the LX45T has none.

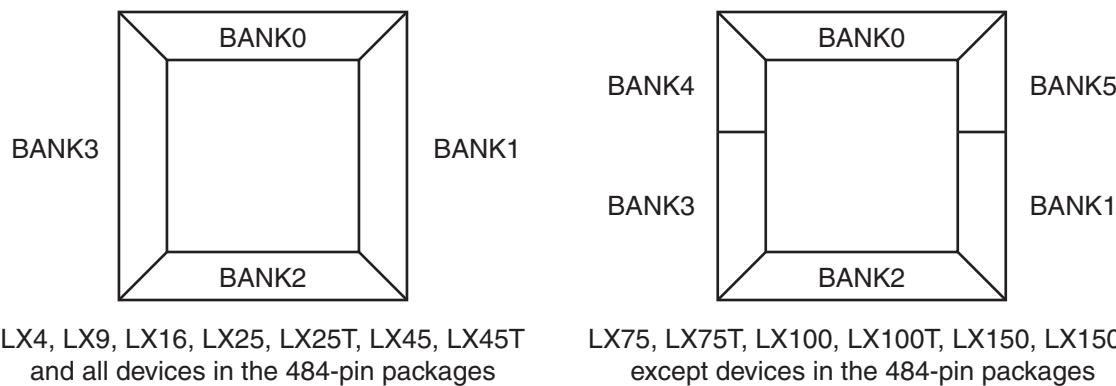

## Encryption Pins

The LX75, LX100, LX150, LX75T, LX100T, and LX150T include three pins used for the bitstream encryption function— $V_{FS}$ ,  $R_{FUSE}$ , and  $V_{BATT}$ . This function is not available in the smaller devices. To maintain compatibility with the larger devices, these pins are left as NCs in the smaller devices. For example, in packages that support both the LX45 or LX45T and the LX75 or LX75T, the LX45 and LX45T will have three NCs in addition to any NCs in place of I/O pins. In the larger devices, these encryption pins should be tied High or Low. However, they can be left floating for ease of migration. In the smaller devices, the encryption pins can be treated as standard NCs, however, to allow for migration, avoid routing active signals through these NC pins. If there is a potential to add encryption and migrate the design to a larger device, connect the pins in the smaller devices as they would be used for encryption.

## MCBs and I/O Banks in the FG(G)676 and FG(G)900

The MCB associated I/O pins have a similar relative layout across multiple packages. A board layout for one package can be similar for a different package.

The larger Spartan-6 devices (LX75/T, LX100/T, and LX150/T) have four MCBs in the larger packages, the FG(G)676 and FG(G)900. To support the extra MCBs, the two side banks 1 and 3 are split in half, with a bank 4 added to the top left and a bank 5 added to the top right ([Figure 7-1](#)).

ug385\_c7\_01\_020910

**Figure 7-1: Spartan-6 FPGA I/O Bank Migration**

In the LX devices, when migrating from the LX45 to the LX75 in the FG(G)676 package, the pinout designations change for some of the pins from bank 3 to bank 4, and for others from bank 1 to bank 5. In addition, many of these pins also add dual-purpose MCB names. For an FG(G)676 design to migrate (in either direction) between the LX45 and the LX75 or larger, restrict MCB use to banks 1 and 3. Treat bank 4 as an extension of bank 3, and treat bank 5 as an extension of bank 1, using the same  $V_{CCO}$  and optional  $V_{REF}$  voltages. Calculate SSO requirements independently for the 4-bank and 6-bank implementations. Also follow all I/O design rules for both implementations, including the restriction of two differential I/O standards per bank.

When the LX75 and LX75T and larger devices are packaged in the 484-pin packages, only four banks are provided in the pinout. The device designs in this package should be for a 4-bank device, not a 6-bank device. Limiting to four banks allows migration between the LX45 and LX45T or smaller devices and the LX75 and LX75T and larger devices in the 484-pin packages.

## GTP Transceiver Banks

The GTP transceivers have a similar relative layout of their associated I/O and power pins across multiple packages. An effective board layout for one package can be used for a different package.

The MGTREFCLK pins in the FG(G)484 package have the P side toward the outside of the package, while in all other packages and all other I/O the N side is toward the outside of the package.

## LX25 and LX25T Migration

The pinouts for the LX25 and LX25T are compatible with the other Spartan-6 devices in the same packages. However, there are two unique characteristics to consider when migrating from the LX25 to other Spartan-6 LX devices or when migrating from the LX25T to other Spartan-6 LXT devices.

- The LX25 and LX25T do not support BPI configuration. For more details, see [UG380, Spartan-6 FPGA Configuration User Guide](#).
- 12 pins in bank 1 and bank 3 of the LX25 and LX25T are associated with different BUFI02 clocking regions for the other devices in the same package. This difference affects package migration when using the FT(G)256, CSG324, and FG(G)484 packages. For more information, see the notes in [Table 2-6](#) through [Table 2-10](#), and refer to the *Clock Inputs* section in [UG382, Spartan-6 FPGA Clocking Resources User Guide](#).

## Pin Names and Physical Pad Locations

In general, the same pin name will have the same location on the device across different packages. For example, the HSWAPEN pin is always in the top-left corner of the device and the I/O name is consistently IO\_L1P\_0. Pins with dual-purpose names, such as the MCB and configuration pins, always refer to the same specific pad location on the device. As a design migrates between densities in a package, these pins will connect to the same general area of the device, allowing the pinout to be maintained. However, some pins may connect to a different area of the device, either because of the different size of the FPGA array or because of different pad-to-package connections. When possible, when migrating between densities, allow the software to change the pin locations to optimize for the new target device.

## Migrating Between Packages

Although general layout will be consistent between packages, there is no direct compatibility, even between the CS(G)484 and FG(G)484, to facilitate migration between packages. Pin names are generally maintained across packages, so a function locked to a particular pin name in one package should use the same I/O pad when migrated to a different package. However, some associations between pin names and physical pad locations can change. Either create new constraints for the new package, or use the software tools to verify that the same pad is being used.

## PlanAhead Software Tool

The PinAhead environment with the PlanAhead™ tool provides an interface to analyze the design and device I/O requirements and to define an I/O pinout configuration that satisfies the needs of both the PCB and FPGA designers. The PlanAhead software enables the creation of I/O port signals and can import an I/O port list in CSV, UCF, or HDL format. Using this tool allows for early and intelligent pinout definition and can eliminate some of the unnecessary pinout related changes that typically happen later in the design.

The graphical tools make it easier to analyze possible pinouts across different options. The PinAhead environment consists of a split workspace showing both the package and device views. There are other views that provide additional I/O information: the clock region view, package pins view, and the I/O ports view. The package pins view table is categorized by I/O banks allowing easy cross selection and highlighting of I/O banks in both the device and package views. This clearly shows the relationship of the physical pin location and the I/O pad location on the device, which simplifies optimal I/O bank selection. Pin information for each pin in the I/O bank is displayed in the package pins view. For more information on the PlanAhead tool, see

<http://www.xilinx.com/tools/planahead.htm>.
